KALE OR BORECOLE CULTURE. This is a very popular boiling green and is a hardy plant and can be easily grown from seed; and will withstand frost and snow. In southern California can be grown the year around. However seed should be sown thinly in drills about the middle of June till to September for the tall sorts about the midacre; transplant the young plants 14 inches apart in rows three feet apart. Later in the season the dwarf sorts may be sown rather thickly in drills to fur-

nish small heads to be cooked like spinach. Plants are usually cut off when the leaves are 6 inches or more in length, but with the fine curled varieties. The leaves can be gathered for use when of good size. If the tall Scotch variety is planted, the lower leaves should be carefully pulled off so that the plants can grow and furnish a continuous supply. This is also true of Jersey. One ounce of seed will produce 4000 plants. Seeds one ounce to 100 feet of drill and 2 lbs. for the acre.

HOTKAPS. Hotkaps are made of a specially prepared translucent waxed paper which admits light to the plant. These make plant to grow quicker and better like in a hot house; mature crops from two to three weeks earlier than ordinarily. Earlier crops make higher prices. Hotkaps are the most convenient and sure way of protecting plants against loss from frost, hail, rain, ground crusting and insects. When the plants have grown to good size and it may still be too early to remove the kap, the top may be split and it will still remain as a protection, but will give the plant additional light, air and room. The wind cannot blow it away, because the machine places dirt around the edges to hold it down. After setting the field looks uniform, like well kept garden. 11 inches in bottom diameter; shipping weight 26 lbs. per 1000.
